                                            Human interferon receptor.

IFN-R; extracellular domain; monoclonal antibody; viral infection; real proliferation; allograft rejection; systemic lupus erythemato. psoriasis; multiple sclerosis; Behcet's Disease; aplastic anaemia; immunodeficiency; measles virus; interferon-alpha-beta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diseases and transplant rejection.
Claim 3; Fig 2; 58pp; English.

DNA encoding the water-soluble polypeptide with a high affinity for IFN-alpha and -beta is isolated by PCR, using appropriate oligonucleotides as primers and cloned cDNA as template. For example, bacteriophage lambda ZAP, containing the entire coding sequence of the IFN-alpha and -beta receptor (Q30533), was incubated with oligos (Q30534 and Q30535. R28496 represents the complete receptor. R28495 lacks the transmembrane and cytoplasmic domains. Both forms bind IFN in the same way as antibodies so are immunosuppressants e.g. for treating autoimmune diseases and graft rejection. They lack the toxic side-effects of known immunosuppressants such as steroids. Sequence 557.AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          29-OCT-1992.

There is no transmembrane domain. The amino acid sequence is predicted from a cDNA clone (see also T73520) obtd. from human myeloma U266 cells. Soluble, non-membrane bound IFNAR splice-deleted forms 1 and 2 (see also W21806) probably regulate the response of human cells to IFNS, either by acting as IFN antagonists or by regulating the activity of the multiple IFN subtypes. They can be expressed in host cells and used to inhibit, modulate or modify the activities of IFNs alpha and beta in cells, telssues and organisms, or for diagnostic purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transmembranal interferon alpha-receptor Interferon alpha-receptor; IFNAR.

Novel, splice-deleted IFNAR forms 1 (W21805) and 2 (W21805) have been detected that lack this transmembrane domain. These, soluble non-membrane bound polypeptides can be expressed in host cells and used to inhibit, modulate or modify the activities of interferons alpha and beta in cells, tissues and organisms, or for diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                IFN receptor extracellular domain.
IFN receptor; interferon receptor; interferon-alpha;
interferon-beta; monoclonal antibody; immunomodulato
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         R71723 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         16-OCT-1995

           Inhibiting, modulating or modifying the activities of interferon(s)

PS Example 3; Fig 7; 46pp; English.

CC Novel splice-deleted interferon alpha-receptor (IFNAR) form 2

CC (W21806) is characterised by a double deletion when compared to

CC characterised by a double deletion when compared to

CC shortened by 6 amino acid residues and is followed by a truncated

CC intracellular domain. There is no transmembrane region. The amino

CC acid sequence is predicted from a cDNA clone (see also T73521) obtd.

CC from human myeloma U266 cells. Soluble, non-membrane bound IFNAR

CC splice-deleted forms 1 (see also W21805) and 2 may regulate the

CC antagonists or by regulating IFN activities. They can be expressed

CC in host cells and used to inhibit, modulate or modify the

CC activities of IFNs alpha and beta in cells, tissues and organisms,

CC corinocal adagnostic purposes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δ
PS Claim 2; Page -; 79pp; English.

CC This sequence is the human CRFB4 sequence, DNA encoding it is used in the Crecombinant DNA (I) of the invention. (I) comprises a sequence (S1) CC encoding the interleukin-10 (IL-10) receptor (ILLOR) and a sequence (S2) encoding the interleukin-10 (IL-10) receptor (ILLOR) and a sequence (S2) CC encoding CRFB4, both operably linked to expression control sequences. CC cells containing (I) may be used to identify agonists/antagonist of CC IL-10. Agonists are potentially useful, e.g. for preventing allograft CC rejection, as vaccine adjuvants, for treatment of photosensitivity. CC infiammation, autoimmune disease and septic shock, while antagonists are potentially useful for increasing immune responses against tumours, CC viruses, bacteria and parasites (especially intracellular pathogens) and CC for preventing organ rejection. A vector containing (I) is used to CC restore, e.g. by gene therapy, IL-10 sensitivity to a cell that expresses a dysfunctional ILLOR and is able to bind IL-10 but not to transduce a containing that expresses CCFB4 sequences (especially ribozymes), can inhibit CL IL-10 activity in cells. Antibodies specific for CRFB4 are used to CC measure and localise CRBF4, for diagnosis of defective IL-10 activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

Recombinant beta-subunit, pref. with the transmembrane anchoring domain deleted or inactivated and with the cytoplasmic domain deleted, may be may be used to treat pathological conditions associated with endogenous IFN-gamma production.

Sequence 332 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RNA. Agonists/antagonists may be administered parenterally, orally or rectally especially by intravenous injection or directly into a tumour or allograft.
                                                                                                                                                                                                                                                                                                                                                                  Novel interferon gamma receptor beta chain polypeptide - for treatment of inflammatory bowel disease and liver damage Claim 3; Fig.2A; 86pp; English. The IFN-gamma receptor beta-subunit encoded by a cDNA clone derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     IFN-gamma receptor beta-subunit.
Interferon-gamma receptor beta subunit;
interferon-gamma-antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Aguet M, Boehni F

                                                        Provided thuman Zeytor7 DNA encodes a type 2 cytokine receptor - useful for treating renal, neural, pancreatic and prostatic diseases  
PS Claim 1; Pages 55-59; 72pp; English.

Claim 1; Pages 55-59; 72pp; English.

Chis represents the Zeytor7 cytokine receptor. Zcytor7 is a ligand-binding receptor polypeptide and is a novel member of the type 2 cytokine receptor family (CRF2). An expression vector containing the Zcytor polypucleotide, operably linked to transcription promoter, a sequence encoding a transmembrane and intracellular domain, or both, and a transcriptional terminator can be used to transform host cells for the transcriptional terminator and be used to transcriptions of the Scytor7 gene and to isolate ligands binding to it. Zcytor7 is preferentially expressed in the kidney, pancreas, prostate or nervous tissue. Agonists of Zcytor7 can be used to stimulate proliferation and differentiation of cell in these organs. The antagonists and agonists can also be used in the treatment of renal, neural, pancreatic and prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Adams RL, Farrah T Whitmore TE; WPI; 98-480798/41.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               18-FEB-1998; U03029.

The sequence is that of human interferon-gamma accessory factor-1. Incorporation of AF-1 into immune and tumour cells re-establishes normal function with elimination of malignant cells. Sequence 337 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WO9505847-A.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2089

interferon gamma receptor beta subunit - mouse
N;Alternate names: IFN-gamma R beta chain; IFN-gamma R species-specific cofactor;
C;Species: Mus musculus (house mouse)
C;Date: 06-Oct-1994 #sequence_revision 18-Nov-1994 #text_change 05-Nov-1999
C;Accession: A49947
R;Hemmi, S.; Bohni, R.; Stark, G.; Di Marco, F.; Aguet, M.
Cell 76, 803-810, 1994
A;Title: A novel member of the interferon receptor family complements functionalit
A;Reference number: A49947; MUID:94170381
A;Accession: A49947
                                                                                                                                                                                         A;Accession: I38501
A;Molecule type: mRNA

Database : SwissProt\_38:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MEDLINE; 95059042.  Colamonici O., Yan H., Domanski P., Handa R., Smalley D., Mullersman J., Witte M., Krishnan K., Krolewski J.; "Direct binding to and tyrosine phosphorylation of the alpha subunit of the type I interferon receptor by p135tyk2 tyrosine kinase."; Mol. Cell. Biol. 14:8133-8142(1994).  MOI. Cell. Biol. 14:8133-8142(1994).  I FING TRIGGERS TYROSINE PHOSPHORYLATION OF A NUMBER OF PROTEINS INCLUDING JAKS, TYK2, STAT PROTEINS AND IFN-R ALPHA-AND BETA- SUBUNITS THEMSELVES.  I SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN  I TISSUE SPECIFICITY: IFN RECEPTORS ARE PRESENT IN ALL TISSUES AND EVEN ON THE SURFACE OF MOST IFN-RESISTANT CELLS.  I SUBCELLULAR LOCATION: TYPE IFN-RESISTANT CELLS.  I SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.  I SIMILARITY: SELONGS TO THE CLASS II CYTOKINE FAMILY OF RECEPTORS. I FORCION: RECEPTOR FOR INTERFERONS ALPHA AND BETA. BINDING TO TYPE
I IFNS TRIGGERS TYROSINE PHOSPHORYLATION OF A NUMBER OF PROTEINS
INCLUDING JAKS, TYK2, STAT PROTEINS AND IFN R ALPHA-AND BETA-
SUBUNITS THEMSELVES.
SUBUNITS THEMSELVES.
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-!- SIMILARITY: BELONGS TO THE CLASS II CYTOXINE FAMILY OF RECEPTORS.
